Calculus II

Improper Integration

Dr. John Ehrke

Abilene Christian University

Fall 2008

Integrals can commit two types of impropriety:

- Type 1** The interval of integration may be infinite. This is technically illegal, because the formal definition of definite integral relies on partitions that are finite.
- Type 2** The integrand may be unbounded on the interval of integration. This is also illegal, because the integrand is not defined at an endpoint of the interval of integration.

Example 10

For each of the following integrals, determine the type of impropriety that occurs.

(a)

$$\int_1^{\infty} \frac{dx}{x^2}$$

(b)

$$\int_1^{\infty} \frac{dx}{x}$$

(c)

$$\int_{-\infty}^{\infty} \frac{dx}{1+x^2}$$

(d)

$$\int_0^{\infty} e^{-x^2} dx$$

(e)

$$\int_0^1 \frac{dx}{x^2}$$

(f)

$$\int_0^1 \frac{dx}{\sqrt{x}}$$

(g)

$$\int_0^{\infty} \frac{dx}{\sqrt{x+x^2}}$$

It will pay to keep these integrals in the back of your mind. They illustrate most of what can go right—and wrong—with improper integration.

Improper Integrals of Type I

- (a) If $\int_a^t f(x) dx$ exists for every number $t \geq a$, then

$$\int_a^{\infty} f(x) dx = \lim_{t \rightarrow \infty} \int_a^t f(x) dx$$

provided this limit exists (as a finite number).

- (b) If $\int_t^b f(x) dx$ exists for every number $t \leq b$, then

$$\int_{-\infty}^b f(x) dx = \lim_{t \rightarrow -\infty} \int_t^b f(x) dx$$

provided this limit exists (as a finite number).

- (c) If both of the above integrals are convergent (i.e. their limits exist), then we define

$$\int_{-\infty}^{\infty} f(x) dx = \int_{-\infty}^a f(x) dx + \int_a^{\infty} f(x) dx.$$

We note that any value $x = a$ can be used to split the integral.

converges or diverges. If it converges find its limit.

Improper Integrals of Type 2

- (a) If f is continuous on $[a, b)$ and is discontinuous at b , then

$$\int_a^b f(x) dx = \lim_{t \rightarrow b^-} \int_a^t f(x) dx$$

if this limit exists (as a finite number).

- (b) If f is continuous on $(a, b]$ and is discontinuous at a , then

$$\int_a^b f(x) dx = \lim_{t \rightarrow a^+} \int_t^b f(x) dx$$

if this limit exists (as a finite number).

- (c) If f has a discontinuity at $c \in (a, b)$, and both $\int_a^c f(x) dx$ and $\int_c^b f(x) dx$ are convergent, then we define

$$\int_a^b f(x) dx = \int_a^c f(x) dx + \int_c^b f(x) dx$$

and has limits according to those types above.

Comparison Test

Suppose that f and g are continuous functions with $f(x) \geq g(x) \geq 0$ for $x \geq a$.

- (a) If $\int_a^\infty f(x) dx$ is convergent, then $\int_a^\infty g(x) dx$ is convergent.
- (b) If $\int_a^\infty g(x) dx$ is divergent, then $\int_a^\infty f(x) dx$ is divergent.

converge or diverge? Why?

Absolute Convergence

Let f and g be continuous functions such that, for all $x \geq a$,

$$0 \leq |f(x)| \leq g(x).$$

Suppose that $\int_a^\infty g(x) dx$ converges. Then $\int_a^\infty f(x) dx$ also converges, and

$$\left| \int_a^\infty f(x) dx \right| \leq \int_a^\infty g(x) dx.$$
